

Talk to Data:

AI-Powered Natural Language Analytics

Problem Statement

While Poshan Tracker captures data at unprecedented scale, stakeholders struggle to interact with and extract meaningful insights due to complex dashboards and limited accessibility.

1

Data is available but difficult to interpret quickly for timely decision-making

2

Field and program teams are limited to predefined reports with no room for exploration

3

Identifying critical gaps (for eg, high anemia or undernutrition zones) is slow and manual

4

Dashboards offer a fixed view. There is no way to ask follow-up or contextual questions

5

Multilingual environments make data access even harder at the last mile

Proposed Solution

Introducing Talk to Data: A conversational AI interface proposed for MoWCD's data ecosystem

What it is : An AI-powered tool that allows users to interact with nutrition and programme data using simple, natural language with no technical expertise required

What it enables

- Ask in text, voice, or preloaded query chips
- Get instant answers as charts and summaries
- Works in Hindi and regional languages
- Go beyond dashboards, ask anything, anytime

Hello! I'm HealthWaani, your AI assistant powered by ML agent. Ask me anything of your data - I can help with questions, explanation, analysis, and much more! You can also use the microphone button to speak your question.

Show me the anaemia status across all AWCs for November 2025

AWC 2 has tested all 6 pregnant women and all 5 lactating mothers with no anaemic cases recorded. AWC 1 has 6 pregnant women registered with zero haemoglobin tests conducted. Across both AWCs, 142 children between 6 months and 5 years have not been tested for haemoglobin. The screening coverage for children is a significant gap.

AWC2 - Pregnant Women

AWC2 - Lactating Mothers

AWC1 - Pregnant Women

Ask me anything or use voice

Proposed Solution (cont..)

Old Way

Scroll through complex dashboards, apply multiple filters to find specific data, still not sure if you found the right answer

Export data to Excel, manually calculate aggregations and build your own analysis. Time consuming and error prone.

Back and forth with data teams to get a specific report, days of wait for one answer

TTD Way

Ask a direct question in plain language and get a precise answer instantly from the exact data you need

Ask for aggregations, comparisons, and trends directly and get instant results without leaving the dashboard

Ask follow up questions naturally, drill deeper, generate and download reports in one conversation

Key features (skipped slide)

1. Plug-and-Play Tool

Solution deployable in Poshan Tracker dashboard/portal/application or the **Support Supervision** mobile applications

2. Conversational, User-Friendly Interface

Ask role-specific queries in plain language (with NLP, multilingual, and basic voice support)

3. Smart Recommendations

Get real-time responses in natural language and suggested next queries based on analysis of DB tables

Expected User Journey (skipped slide)

STEP 1

User enters a question
in natural language

STEP 2

LLM interprets intent
(domain-specific + multilingual)

STEP 3

System fetches data from
POSHAN Tracker KPIs/workflows

STEP 4

Generates instant insights &
visualizations

STEP 5

User saves/uses insights for
action plans & reporting

Value Proposition

Faster decisions, better outcomes

Officers at every level can get answers to specific nutrition questions instantly, enabling timely interventions where they matter most

Every data point gets used

The rich data that AWWs capture daily becomes truly actionable, surfaced as insights rather than sitting behind static charts

Designed for the scale of POSHAN

From national targets to block level performance, Talk to Data works across the entire programme hierarchy without added infrastructure

Inclusive by Language

Supports Hindi and regional languages so every stakeholder, from ministry to field, can engage with data in the way that works for them

Target Users

- **Ministry / Leadership Stakeholders** (National Level)
"How many states have met their Q3 POSHAN 2.0 targets?"
- **State & District Programme Managers** (State Level)
"Show me districts with worsening stunting trends this quarter"
- **CDPOs / Supervisors** (Block Level)
"Which centres in my block have not submitted data this month?"
- **Field Workers** (Anganwadi ecosystem)
"Mere centre mein kitni mahilaon ka weight record hua?"

Technical Workflow

Note: Talk to Data goes beyond standard row and column calculations. It identifies deep linkages and patterns across multiple tables simultaneously, surfacing insights that traditional dashboards and reports cannot.

Poshan Tracker
AI Assistant

Hello! I'm Talk to Data, your AI assistant powered by ML agent. Ask me anything of your data - I can help with questions, explanation, analysis, and much more! You can also use the microphone button to speak your question.

Ask me anything or use voice

Press Enter to send • Shift + Enter for new line • Click mic to speak

- Directly interact with any visual on the dashboard
- Ask follow-up queries naturally, in your language
- Generate reports and aggregations instantly
- Export and share results in one click

Data Security & Responsible AI

Pre deployment

- Speech and language processing powered by Bhashini — Government of India's own multilingual AI platform
- No model is integrated without explicit government clearance and documented due diligence
- Infrastructure scoped to MeitY empanelled cloud providers with data centres located within India
- Full compliance with Digital Personal Data Protection Act (DPDPA) 2023 before go-live

Post Deployment

- All data stored and processed on servers within India only
- Beneficiary data encrypted at rest and in transit at all times
- Role based access — no unauthorised visibility of sensitive records
- Model processes minimum data needed
- Queries never used to retrain or modify the underlying model
- Every interaction logged and auditable at any point

Phased Approach
